

CLAIM AMENDMENTS

Please amend the claims as follows:

1. (currently amended) ~~An improved~~ A method of correcting for atmospheric effects on a remote image of the Earth's surface taken from above, wherein the image comprises a ~~number~~ plurality of images of the same scene each including a large number of pixels, each at a different wavelength band, and including infrared through visible wavelengths, comprising:
 - a. providing a radiation transport model that relates spectral radiance to spectral reflectance via a set of parameters;
 - b. providing a discrete number of trial aerosol visibility values for at least one of one or both of trial aerosol property values and aerosol types;
 - c. using the radiation transport model to calculate the model parameter values for each of the trial aerosol visibility values;
 - d. selecting image pixels having unknown reflectances but having one or more presumed, predefined ratios of reflectances among two or more specific wavelength bands;
 - e. using the calculated ~~radiation transport model parameter~~ [[s]] values to determine the surface reflectance for the selected image pixels for each of the specific wavelength bands for each combination of trial visibility value and trial aerosol property value or values, or aerosol type;
 - f. comparing the determined surface reflectances to the predefined ratio of reflectances;
and
 - g. resolving from the comparison a corrected image visibility value for each trial aerosol property value or values or aerosol type.

2. (original) The method of claim 1, in which using the radiation transport model to calculate the model parameter values includes performing calculations for the specific geometric conditions of solar illumination and sensor viewing that apply to the image being analyzed.
3. (original) The method of claim 1, in which using the radiation transport model to calculate the model parameter values includes performing calculations for a plurality of geometric conditions of solar illumination and sensor viewing, storing the calculation results, and interpolating the stored results to the specific geometric conditions that apply to the image being analyzed.
4. (original) The method of claim 1, in which using the radiation transport model to calculate the model parameter values includes performing calculations of the radiance from the surface that is scattered into the sensor by weighting the spectra from different parts of the surface according to their contributions to each pixel.
5. (original) The method of claim 1, in which the radiation transport model includes MODTRAN.
6. (original) The method of claim 1, in which the sensor viewing angle is nadir.
7. (original) The method of claim 1, in which the sensor viewing angle is off-nadir.
- 8-35 (canceled)
36. (currently amended) The method of claim 1, in which trial aerosol visibility values are provided for a plurality of trial aerosol property values and/or a plurality of aerosol types; a multiplicity of specific wavelength bands are specified; the number of predefined ratios of reflectances is greater than one; and in which by comparing the determined surface reflectances to the predefined ratios of reflectances both the corrected image visibility value and the aerosol properties or the aerosol type are resolved.

37. (new) The method of claim 1, in which trial aerosol visibility values are provided for a plurality of aerosol types; a multiplicity of specific wavelength bands are specified; the number of predefined ratios of reflectances is greater than one; and in which by comparing the determined surface reflectances to the predefined ratios of reflectances both the corrected image visibility value and the aerosol properties or the aerosol type are resolved.
